

## CWE-215: Insertion of Sensitive Information Into Debugging Code

Weakness ID: 215  
Vulnerability Mapping: ALLOWED  
Abstraction: Base

View customized information:

- Conceptual
- Operational
- Mapping Friendly
- Complete
- Custom

Description

The product inserts sensitive information into debugging code, which could expose this information if the debugging code is not disabled in production.

Extended Description

When debugging, it may be necessary to report detailed information to the programmer. However, if the debugging code is not disabled when the product is operating in a production environment, then this sensitive information may be exposed to attackers.

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Technical Impact: Read Application Data	

Potential Mitigations

Phase: Implementation

Do not leave debug statements that could be executed in the source code. Ensure that all debug information is eradicated before releasing the software.

Phase: Architecture and Design

Strategy: Separation of Privilege

Compartmentalize the system to have "safe" areas where trust boundaries can be unambiguously drawn. Do not allow sensitive data to go outside of the trust boundary and always be careful when interfacing with a compartment outside of the safe area.

Ensure that appropriate compartmentalization is built into the system design, and the compartmentalization allows for and reinforces privilege separation functionality. Architects and designers should rely on the principle of least privilege to decide the appropriate time to use privileges and the time to drop privileges.

Relationships

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name

Implementation	

Applicable Platforms

Languages

Class: Not Language-Specific (Undetermined Prevalence)

Demonstrative Examples

Example 1

The following program changes its behavior based on a debug flag.

Example Language: JSP (bad code)

```
<% if (Boolean.getBoolean("debugEnabled")) {
  %>
  User account number: <%= acctNo %>
  <%
  } %>
```

The code writes sensitive debug information to the client browser if the "debugEnabled" flag is set to true .

Observed Examples

Reference	Description
<a href="#">CVE-2004-2268</a>	Password exposed in debug information.
<a href="#">CVE-2002-0918</a>	CGI script includes sensitive information in debug messages when an error is triggered.
<a href="#">CVE-2003-1078</a>	FTP client with debug option enabled shows password to the screen.

Detection Methods

Automated Static Analysis

Automated static analysis, commonly referred to as Static Application Security Testing (SAST), can find some instances of this weakness by analyzing source code (or binary/compiled code) without having to execute it. Typically, this is done by building a model of data flow and control flow, then searching for potentially-vulnerable patterns that connect "sources" (origins of input) with "sinks" (destinations where the data interacts with external components, a lower layer such as the OS, etc.)

Effectiveness: High

Vulnerability Mapping Notes

Usage: ALLOWED (this CWE ID could be used to map to real-world vulnerabilities)

Reason: Acceptable-Use

Rationale:

This CWE entry is at the Base level of abstraction, which is a preferred level of abstraction for mapping to the root causes of vulnerabilities.

Comments:

Carefully read both the name and description to ensure that this mapping is an appropriate fit. Do not try to 'force' a mapping to a lower-level Base/Variant simply to comply with this preferred level of abstraction.

Notes

Relationship

This overlaps other categories.

Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
